

A One Day Internet Research Technique Master Class

Thursday, September 9, 2010 8:00 a.m. - 4:00 p.m.
Location: I.B.M Building 227 - 11 Avenue SW Calgary

From the routine investigations conducted by frontline employees to strategic and tactical intelligence gathering operations, security professionals are increasingly using the Internet to find critical leads in cases. Internet users often employ highly ineffective search techniques and don't have the skills necessary to properly analyze search results. Are you aware of the "footprints" you leave on a server every time you visit a web site? If viewed from a corporate computer system, the administrator of the target website can frequently learn what organization has visited, when, for how long and even what keywords were used in what search engine by that agency to locate their page.

This comprehensive one-day master class will provide an overview of techniques that can be utilized to effectively use the Internet as a research and open source intelligence tool.

Learn About.

- Searching techniques, search tools and case studies.
- Investigative errors that have compromised cases in the past.
- Advanced search techniques on a number of "surface" and "deep" web search resources.
- Freely available tools to archive, compile and analyze Internet sourced information.
- Protecting privacy online and maintaining operational integrity.

Don't miss your opportunity to attend.
